# **PRODUCT ASSURANCE ELEMENTS**

- **Quality Assurance**
- **Electronic Parts Reliability Engineering**
- **Environmental Requirements**
- **Reliability**
- **Software Product Assurance**
- **System Safety**

# PRODUCT ASSURANCE = “VALUE ADDED”

Product Assurance Discipline	Examples of Value Added
Electronic Parts Reliability Engineering	<ul style="list-style-type: none"><li>• Assist in obtaining highest quality parts appropriate to mission and to project resource constraints</li><li>• Thoroughly analyze parts failures</li><li>• Provide consultation to electronic equipment designers</li><li>• Reduce costs through commonbuys</li><li>• Avoid problems through parts-alerts monitoring</li></ul>
Environment Requirements	<ul style="list-style-type: none"><li>• Provide technical criteria for design of flight equipment to operate within ground operations and mission environments</li><li>• Define and oversee implementation of efficient productive environmental testing</li></ul>

PRODUCT ASSURANCE OVERVIEW

# PRODUCT ASSURANCE = "VALUE ADDED" (cont.)

Product Assurance Discipline	Examples of Value Added
Quality Assurance	<ul style="list-style-type: none"><li>• Process evaluation and problem resolution</li><li>• Failure-prevention controls development</li><li>• Advanced interconnect development/qualification</li><li>• Hardware-manufacturing/training</li><li>• Inspection and documentation to assure quality workmanship</li></ul>
Reliability	<ul style="list-style-type: none"><li>• Provide electronic and mechanical hardware-reliability design support throughout development cycle</li><li>• Validate PFR closure for adequate resolution and verification of corrective action</li></ul>

PRODUCT ASSURANCE OVERVIEW

# PRODUCT ASSURANCE = “VALUE ADDED” (cont.)

Product Assurance Discipline	Examples of Value Added
Software Product Assurance	<ul style="list-style-type: none"><li>• Support the development of software requirements, design, coding, inspection cycles — early problems/defect avoidance and detection reduces software development costs</li></ul>
System Safety	<ul style="list-style-type: none"><li>• Provide engineering support to hardware and software design to ensure they function without a safety-related anomaly</li><li>• Provide safety engineering support to ensure compliance with launch-agency requirements</li><li>• Ensure safety in flight hardware ground handling (for both hardware and personnel)</li></ul>

## PRODUCT ASSURANCE OVERVIEW

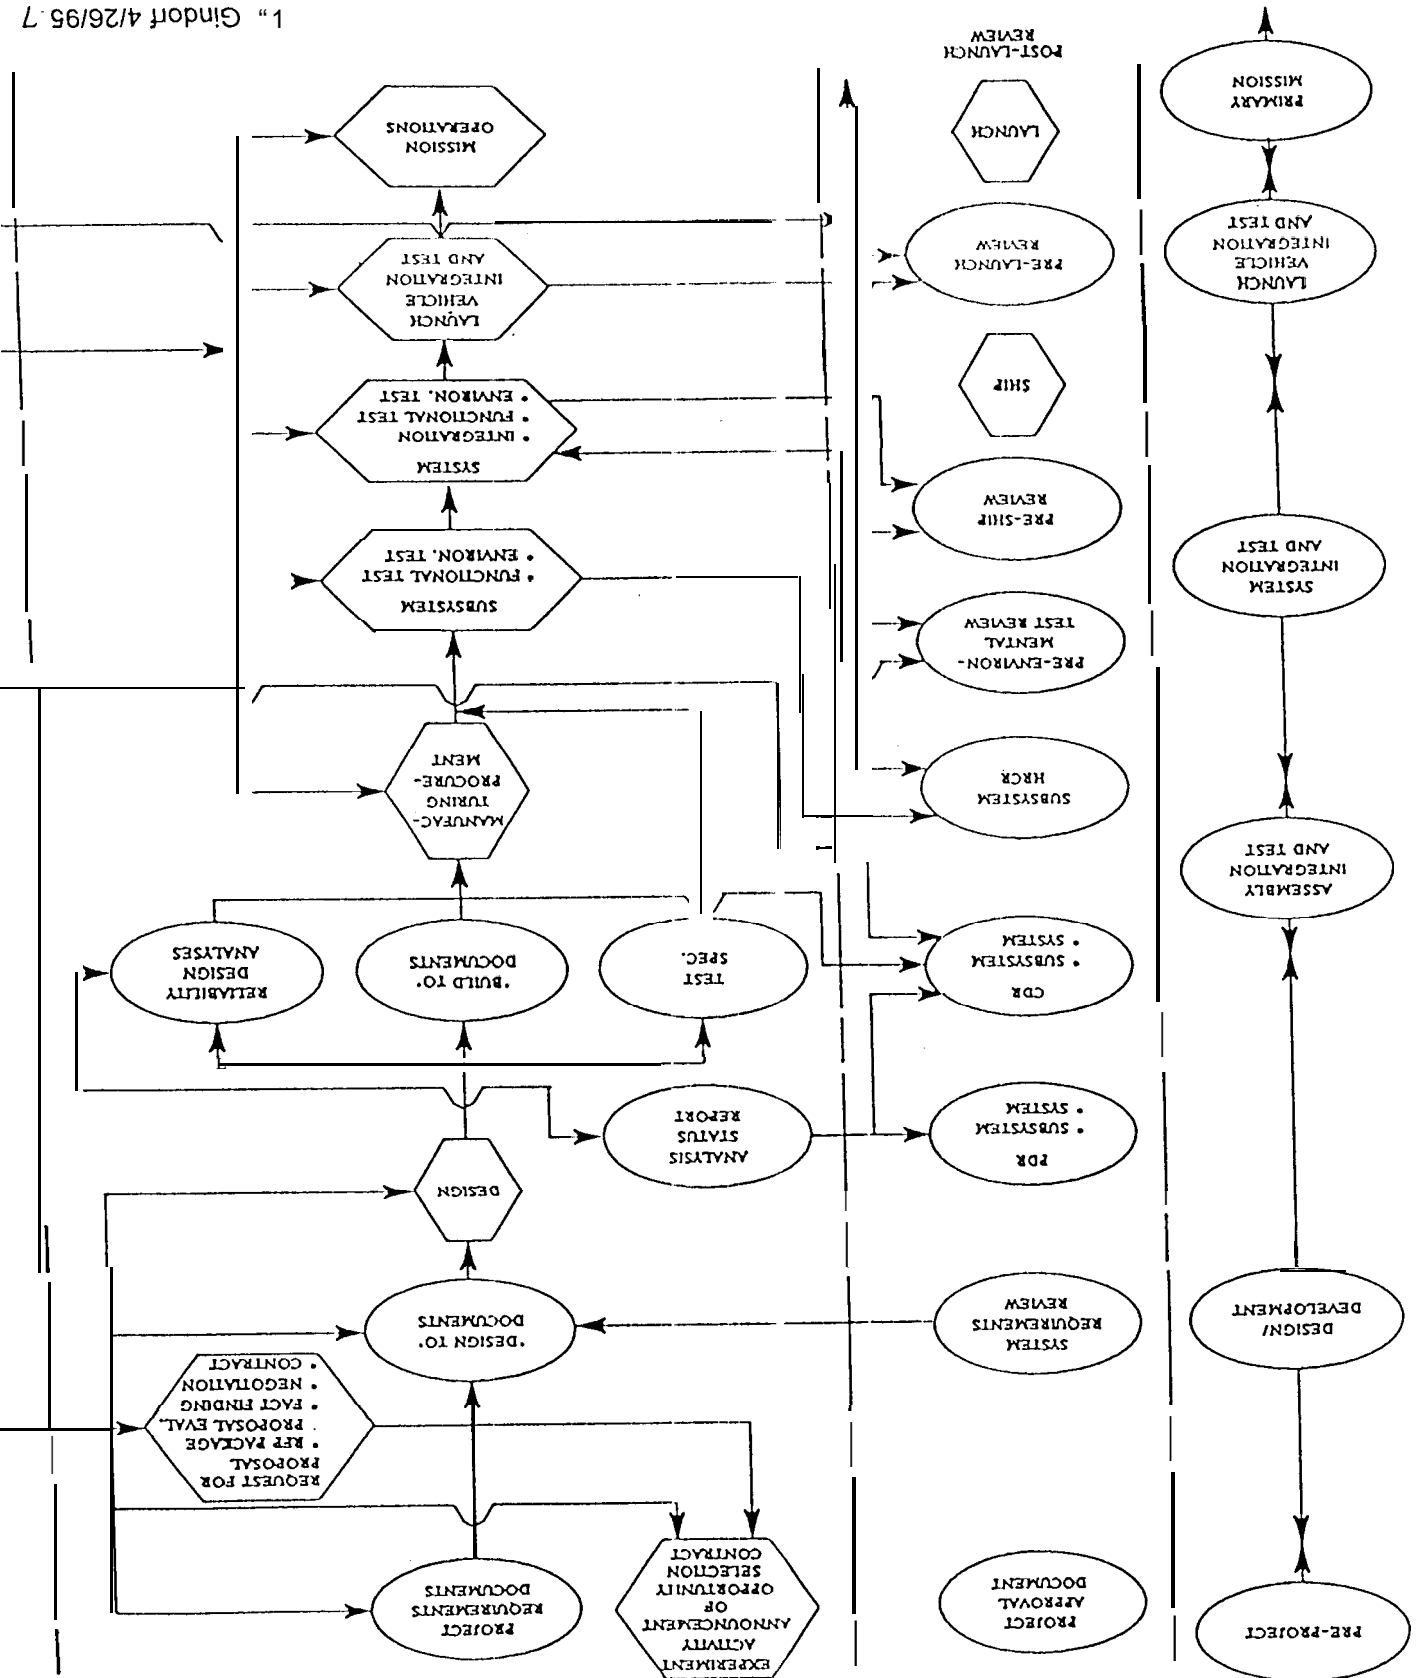

# FLOW OF PRODUCT ASSURANCE INTO PROJECT EVENTS

PROJECT/TECHNICAL DIVISION/EXPERIMENTER ACTIVITIES

REVIEWS &  
MILESTONES

PROJECT PHASE

# QUALITY ASSURANCE FUNCTION

- Planning of project and contractor QA hardware effort
- Independent information source for quality, status and assessment of hardware
- Contribution to hardware development
  - Ensure hardware conforms to requirements (monitor contractors)
  - Inspect./observe hardware fabrication
  - Detect problems early
  - Implement corrective action
  - Verify test performance to specification/procedures
  - Train and certify (soldering, polymeric, etc.)
  - Evaluate qualification status of fabrication and rework processes
- Review/approval of manufacturing plans, procedures, and subcontractor QA documents
- Inspection and observation
  - Handling and transportation packaging
  - Hardware integration (receiving inspection, data packaging review, bonded stores)

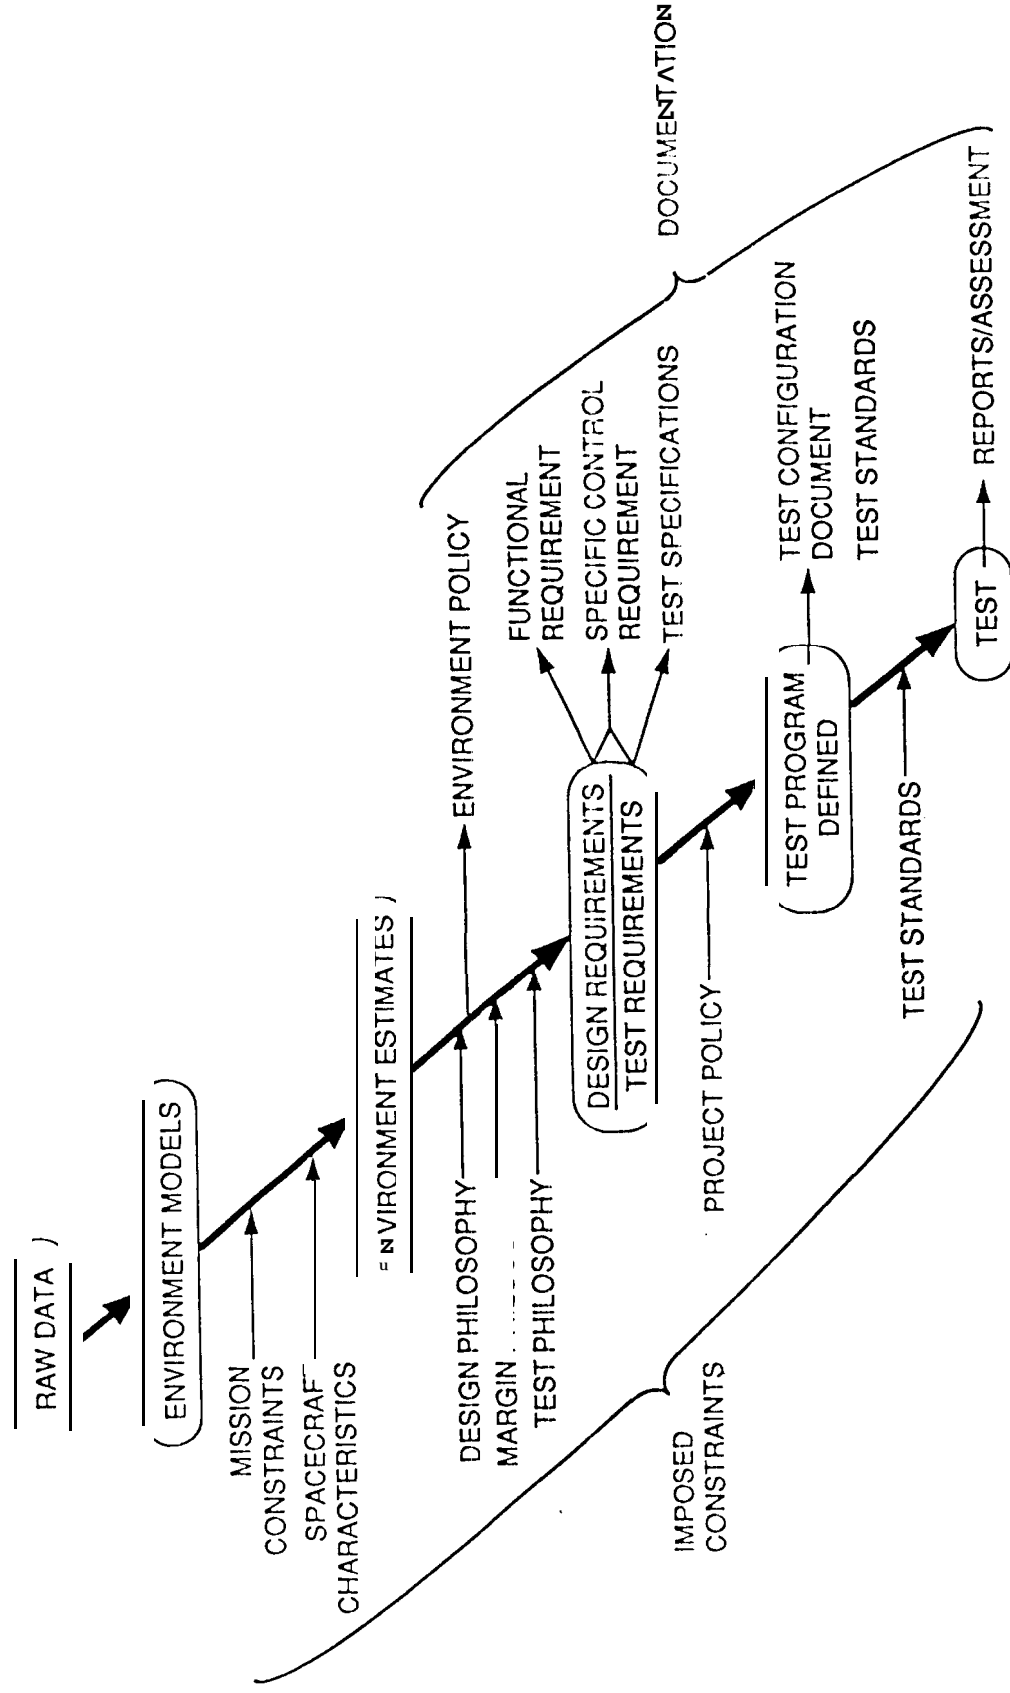

# ENVIRONMENTAL REQUIREMENTS FUNCTIONS

- **Systematic and structured design and test requirements that, upon implementation, demonstrate confidence in mission environmental compatibility**
- **Visible management structure for consistent implementation of the environmental programs and individual projects across the Laboratory**
- **Evaluations and assessments of hardware environmental risks**

RELIABILITY ENGINEERING

# RELIABILITY FUNCTIONS

- **Planning (RFPs, Requirements)**

- **Controls (ECRs, PFRs, Waivers, DDRs, Status Reports)**

- **Analysis**

- |  |  |
|--|--|
| • Electronic circuit stress analysis and review        | — Failure analysis and reporting                     |
| • Worst-case analysis and review                       | — Fault tree analysis (FTA)                          |
| • Radiation circuits effects analysis and review       | — Failure mode effects criticality analysis (FMECA)  |
| • ECRS analysis/approval                               | — Mathematical modeling                              |
| • Waivers analysis/approval                            | — Numerical reliability prediction for trade studies |
| • PFRs analysis/approval                               | — Maintainability                                    |
| • Thermal stress to piece part level ( $T_{j, rise}$ ) | — Availability                                       |

- **Technical Reviews and Risk Assessments**

# RELIABILITY ENGINEERING PROBLEM/FAILURE REPORTING

<b>JPL</b> Jet Propulsion Laboratory California Institute of Technology 4800 Oak Grove Drive Pasadena, California 91109		<b>PROBLEM/FAILURE REPORT</b>		No. 54185 1/26	
1. PROJECT GALILEO		2. VENDOR JPL		3. PROBLEM/FAILURE DATE 12/13/88	
4. SUB-SYSTEM 2010		5. NOMENCLATURE RPM		6. SERIAL NUMBER SAT OR P 1369	
7. 1ST TIER NUMBER		8. 2ND TIER NUMBER		9. 3RD TIER NUMBER	
10. 4TH TIER NUMBER		11. REPORTING LOCATION JPL SEC 353		12. PROBLEM FAILURE NOTED DURING <input type="checkbox"/> FA TESTING <input type="checkbox"/> SYSTEMS TESTING <input checked="" type="checkbox"/> OTHER Transportation	
13. SPECIFIC ENVIRONMENT <input checked="" type="checkbox"/> AMB <input type="checkbox"/> TEMP <input type="checkbox"/> VAC <input type="checkbox"/> SHOCK <input type="checkbox"/> VIS <input type="checkbox"/> TH/VAC <input type="checkbox"/> BENCH <input type="checkbox"/> ACOUSTIC <input type="checkbox"/> OTHER Packing Case		14. DESCRIPTION OF PROBLEM/FAILURE - RPM TRANSPORTATION SHOCK - During the transportation of the RPM from MBG, West Germany, to JPL, the RPM packing case experienced a shock which resulted in damage to the temperature/humidity recording instrument, and the subsequent loss of future humidity recording. Preliminary review of the three Axis Accelerometer Recorders indicates low level shock was imparted to the RPM support structure within the packing case. This document is to assure that the shock recorder's data are reviewed by MBG personnel and that an analysis and report (CONTINUED ON PAGE 2)		15. VERIFICATION AND ANALYSIS The shock recorder strip chart was analyzed by the shock recorder manufacturer (see pages 3 and 4 of the attached MCR RPM-MC 885), and the shock level sustained by the RPM was confirmed to be within admissible limits (Ref. RPM-MC 885). The temperature/humidity recording instrument was damaged because it was not on the damped portion of the RPM transporter, and because it is made for stationary use only. Though the humidity was not measured after the shock, it could not have exceeded 65% because the desiccants within the container were blue (Ref. RPM-MC 885 and desiccant spec.). NOTE: The humidity of the RPM environment is not critical (the RPM is frequently stored in non-environmentally controlled areas).	
16. CAUSE OF PROBLEM/FAILURE <input checked="" type="checkbox"/> DESIGN <input type="checkbox"/> WORKMANSHIP <input type="checkbox"/> PIECE PART <input type="checkbox"/> TEST ERROR <input type="checkbox"/> MISPLACEMENT <input type="checkbox"/> OTHER		17. A) PIECE PART NAME NUMBER B) SERIAL NO C) CIRCUIT DESIG D) MANUFACTURER		18. EFFECT H-2	
PERSON COMPLETING SECTION II Carl S. Engelbrecht		SIGNATURE CRSE		DATE 5-12-89	
19. CORRECTIVE ACTION TAKEN Because the shock level and humidity of the RPM during transportation were within acceptable limits at all times, there is no corrective action required. The action required in section 14 above (i.e. a review of the shock recorder data and an analysis of the situation were completed, and report was submitted by MBG) has been completed by MBG (see attached MCR RPM-MC 885 and attachments) and accepted by JPL (Ref. closure of MCR). The RPM should be used "AS-IS".		20. DISPOSITION OF SUBSYSTEM OR ASSEMBLY <input type="checkbox"/> REDESIGNED <input type="checkbox"/> REWORKED <input type="checkbox"/> READJUSTED <input type="checkbox"/> SCRAPPED <input type="checkbox"/> RETESTED <input checked="" type="checkbox"/> OTHER VSR 85 Is		21. RELIABILITY ENGINEERING

## MISSION RISK ASSESSMENT BASED ON PFR RATINGS

Failure Effect Rating	Failure Cause/Corrective Action Rating			
	Certain Corrective Action		Uncertain Corrective Action	
	Known Cause (1)	Unknown Cause (2)	Known Cause (3)	Unknown Cause (4)
None or Negligible (1)	No Additional Mission Risk		Negligible Additional Mission Risk	
Moderate or Significant (2) or Major or Catastrophic (3)			Known or Potential Additional Mission Risk (RED FLAG)	

# SOFTWARE PRODUCT ASSURANCE FUNCTION

## **. Goal**

- **To help improve the operation reliability of projects while in flight**
  - **An effort to detect and correct, as early as possible, errors that exist in the commanding process to eliminate command errors sent to the spacecraft**
- **To achieve this goal, during mission operations**
  - **Review flight operations documentation and processes, and recommend modification to improve the process**
  - **Monitor the command process**
  - **Monitor the problem/failure reporting system**
  - **Participate with flight teams in analyzing command incidents and developing corrective actions**

# SYSTEMS SAFETY FUNCTION

- **Develop and implement a project safety plan and schedule (preproject to launch) that will meet all appropriate safety requirements**
- **Develop a safety-oriented organization to minimize risk to people and hardware, and to maximize probability of project success**
- **Ensure the priority of project's safety role and that personnel safety is not compromised**

# SUMMARY

- **Many pressures to reduce cost**
- **Determining the proper balance between cost and risk needs more attention**
- **Ultimately any failure is viewed as bad regardless of what is agreed upon initially**
- **Great and interesting challenge for Safety & Mission Assurance to determine what the future product assurance requirements should be**
